

$^{40}\text{Ca}(\mu^-, \nu\alpha n\gamma)$ 2006Me08

2006Me08: Muons were generated from the decay of 90-MeV/c π^- beam in a 6-m, 1.2-T superconducting solenoid and were selected by a bending magnet at the M9B beamline at TRIUMF. The target was 15-g natural calcium. γ rays and x rays were detected using a 186-cm³ HPGe detector. Charged particles caused by electrons from muon decay were tagged by a plastic scintillator in front of the HPGe detector. Measured E_γ , I_γ , $E(x \text{ ray})$, $I(x \text{ ray})$. Deduced levels, muon capture yields. MeV/c from M9B beamline at TRIUMF. Measured I_γ , $\gamma\gamma$, γ -p using two HPGe detectors.

Muonic Lyman series for natural Calcium
